

Installing the Lukas LK-5900 DUO + LK-290

BMW F20 (F30)

Notes from my installation:

1. Consider access to buttons SD-card and cables before you attach the cameras. Space behind the rear view mirror can be limited.
2. Use the door rubber seals to run the cables under – self explaining once you get going.
3. Lid on the front fuse box is closing tightly. Have some slack inside the box to prevent the cables being pulled when closed.
4. Pull the upper left corner to remove the cover under the glove compartment (after removing the screws).
 - Attaching the cover again is tricky. Note the hooks on the inside part and make sure to align all clips.
5. Use a big screwdriver to puncture the foam behind the firewall plug and pull the wires through with a tie strap.
6. Adjust the settings on the LK-290 before you install it (not a pleasant experience doing it on your back with your head in the foot well).
7. Enjoy 😊
